LAB 7 – FUZZ TESTING

Shopping Cart Input Validation · Hypothesis and pytest

1. Original application execution

The original, unmodified application is run with the sample cart, promo code, and pincode. The terminal shows the resulting cart total (270), discount percentage (20), and delivery zone (South).

Captured 12 November 2026 · 11:54 AM

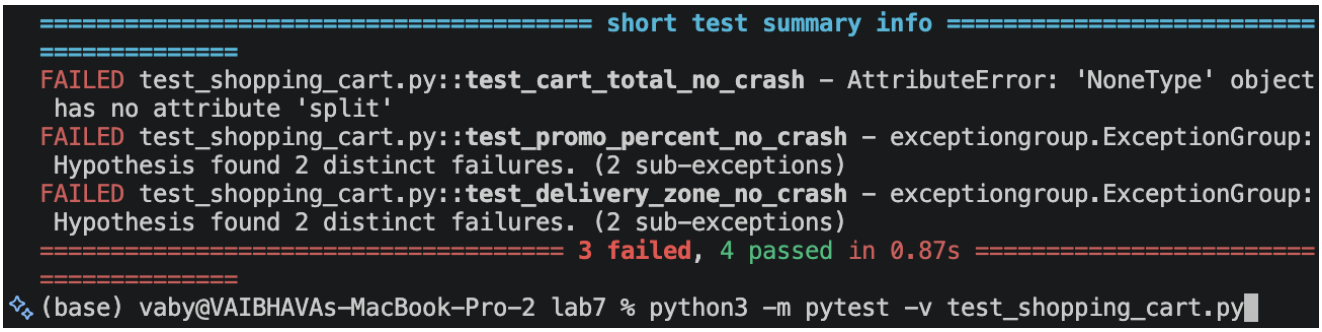

Evidence sequence: original run → fuzz-discovered failures → fixed run → passing regression/property tests.

2. Fuzz testing the original implementation

The Hypothesis test run against the original implementation reports three failing no-crash tests and four passing property/example tests. The visible summary is 3 failed, 4 passed (0.87s).

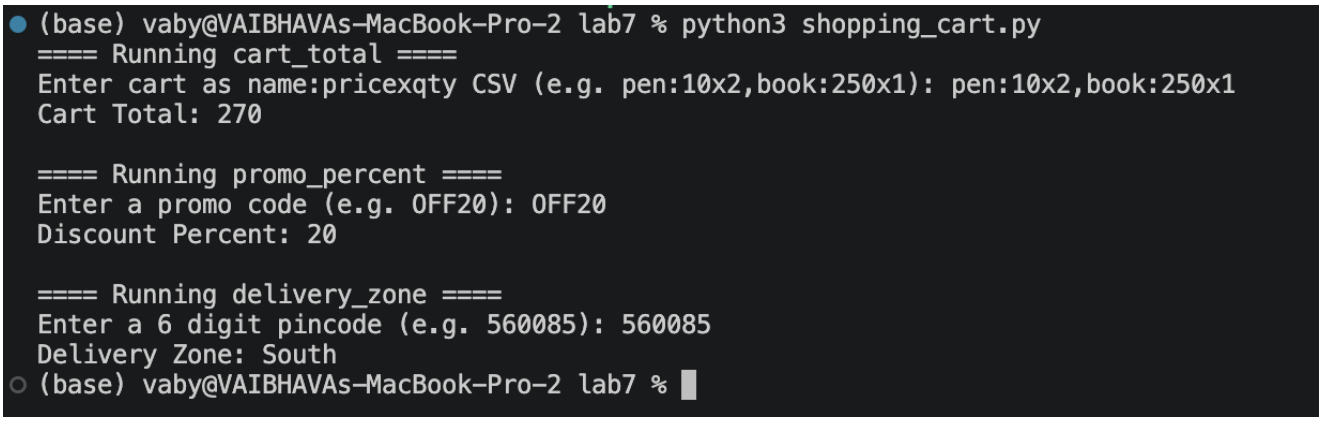

Captured 12 November 2026 · 11:56 AM

3. Fixed application execution

The corrected shopping_cart.py is run with the same sample inputs. The displayed results are Cart Total: 270, Discount Percent: 20, and Delivery Zone: South.

Captured 12 November 2026 · 11:58 AM

4. Final Hypothesis test verification

The final test run against the restored fixed implementation collects all seven tests and shows every test passing. The terminal summary is 7 passed in 0.36s.
